

# RE-ENGINEERING TODAY'S HOSPITALS TO PREVENT INFECTIONS TOMORROW

EA Bryce MD FRCPC  
Division of Medical Microbiology and Infection Control  
Department of Pathology, Faculty of Medicine, UBC

# DISCLOSURE

Research: Biomerieux, Teck Resources Limited

A scenic view of a canal in Amsterdam at dusk. The canal is lined with trees and buildings, and a bridge is visible in the background. The water reflects the lights from the street lamps and buildings. The sky is a mix of blue and orange.

# OBJECTIVES

1

Discuss principles of engineering for infection reduction

2

Describe the Genome BMT Pilot Project

3

Review the results from the pilot project and the next steps and existing gaps in our knowledge on self-disinfecting surfaces

Microbes transfer between Patients, Healthcare Workers, and Environment

# ADDRESSING THE ENVIRONMENT

**environmental factors contributing to increase risk of cross-contamination:**

- (1) Design (multi vs single bed)**
- (2) thoroughness of cleaning**
- (3) type of cleaning agent**
- (4) types of surfaces that need to be cleaned**

A photograph of a hospital room. In the foreground, a white patient bed with blue accents is partially visible. Behind it, there's a medical cart with various supplies. In the background, a window with blue blinds is visible. The room is brightly lit.

# NEW TECHNOLOGIES SURFACE DISINFECTION

**Ultraviolet C disinfection**

**LED white light**

**Vapor systems**

# SELF- DISINFECTING SURFACES

Materials with inherent  
antimicrobial activity

Photoactivated  
antimicrobicides

Altered surface topography

# UV SURFACE DISINFECTION

used in laboratories for years

new literature demonstrates value  
as an adjunct to cleaning

reduces CD spores, MRSA, VRE in  
hospital rooms

evaluation must include ability to  
integrate technology into workflow

## COMMON QUESTIONS

### **IS IT SAFE?**

Yes, sensors and barriers prevent  
accidental human exposure  
UVC does not penetrate glass

### **DOES IT WORK?**

Yes, both in laboratory and clinical  
setting

## CONTINUOUS UVC

Low pressure mercury 254 nm  
Cycle time: 5 to >60 min  
One study suggests more effective  
than pulsed xenon  
Purchase prices vary significantly

## PULSED XENON

Pulsed light from 200 to 320 nm  
Cycle time 5-7 min  
Purchase prices also vary

Types of UVC Technology Available

Tru-D  
SmartUVC

# DOES UVC WORK CLINICALLY?

Many studies show decrease in  
bioburden

Limited studies **on impact on HAI  
reduction**

Vianna PG AJIC 2016;44:299-  
303

Napolitano NA AJIC  
2015;43:1342-6

Anderson D Lancet 2017

# PURCHASE CONSIDERATIONS

Canadian facilities work at 100% capacity.  
No ability to extend “down time” for  
rooms

Most UVC machines are microbiologically  
effective

Functionality, integration into workflow ,  
operator considerations become the  
primary determinants for purchase  
Cycle time may become paramount

**Consider how your  
facilities operates when  
selecting UVC machines**

# PERMANENT UVC INSTALLATION IN BATHROOMS

J Cooper, G Astrakianskis, K Bartlet, E Bryce

**The Problem:** Common shared hallway bathrooms with limited sink access

**The background:** Toilets generate aerosols of bacteria and viruses that follow air currents for long distances or land on surfaces.

**The question:** Is permanently installed UVC light effective in decreasing microorganisms in the air and on surfaces

# THE STUDY DESIGN

J Cooper, G Astrakianskis, K Bartlet, E Bryce

Shared hallway washrooms of similar design and size with or without either UVC (with 5 minute run time)

150 litre air samples were collected 5 minutes and 30 seconds after patient use and cultured

Surface samples from toilet and counter cultured

# Washroom Layout and Sampling Locations

Sample	Geometric Mean Concentration	Geometric Standard Deviation	% Reduction in Mean Concentration
Seat Bacteria <sup>1</sup> UV+ve	7.7	5.5	97*
Seat Bacteria <sup>1</sup> UV-ve	224	7.5	
Counter Bacteria <sup>1</sup> UV+ve	1.6	2.2	95*
Counter Bacteria <sup>1</sup> UV-ve	31	3.1	
Anaerobic Bioaerosol <sup>2</sup> UV+ve	45	2.4	47.7**
Anaerobic Bioaerosol <sup>2</sup> UV-ve	86	2.8	
Aerobic Bioaerosol <sup>2</sup> UV+ve	153.2	1.7	35.2**
Aerobic Bioaerosol <sup>2</sup> UV-ve	236.5	1.4	

Counter Contact Plate  
UV-ve

Counter Contact Plate  
UV+ve

# STUDY CONCLUSIONS

J Cooper, G Astrakianskis, K Bartlet, E Bryce

Automated, permanent UVC lights  
can decrease exposure to potential  
pathogens

Again, careful consideration of  
where these devices are placed –  
AND WHY – is required.

# REDEFINE SANITIZATION OF MOBILE HAND HELD DEVICES

**mobile devices** represent an often-ignored reservoir for pathogenic bacteria

recent studies demonstrate that 82% of mobile phones show **bacterial contamination**

these devices are used by **patients, visitors and healthcare practitioners**

it sanitizes in just 35 seconds with a **360-degree UV exposure**

ALUVIS – a unique ultraviolet system for mobile devices – **fills the gap** in your hand sanitizing procedure

**even with appropriate hand sanitization** we need to prevent pathogen growth on these devices in order to **reduce cross-contamination**

greater than 99.9% effective against most common pathogens, and always ready for the next device, **eliminating waiting time**

table top machine may be placed in **high-risk areas** such as emergency room, nurses' and doctors' lounges, ICU, outpatient registration and ambulatory care center

come visit Angelini Pharma at **BOOTH 347** and bring this insert with you to receive a **special gift!**

## UVC FOR MOBILE EQUIPMENT

Li, Wong, Rose, Wickham, Bryce Am J Infect Control 2016

Hand-held equipment can be fomites for microbe transmission

Aluvis machine is effective at disinfecting hand-held devices, but requires some human factors optimization

# Ambient LED and White Light

405 nanometers: Peak germicidal activity via photoexcitation of porphyrin molecules

# STABILIZED AQUEOUS OZONE

(1) Machine generates ozone and binds with  $H_2O$

(2) Ozonated water comes in contact with pathogens

(3) Ozone molecule comes in contact with bacterial cell wall – oxidative burst creates holes, and pathogen dies

(4) Only normal water remains

# BACKGROUND

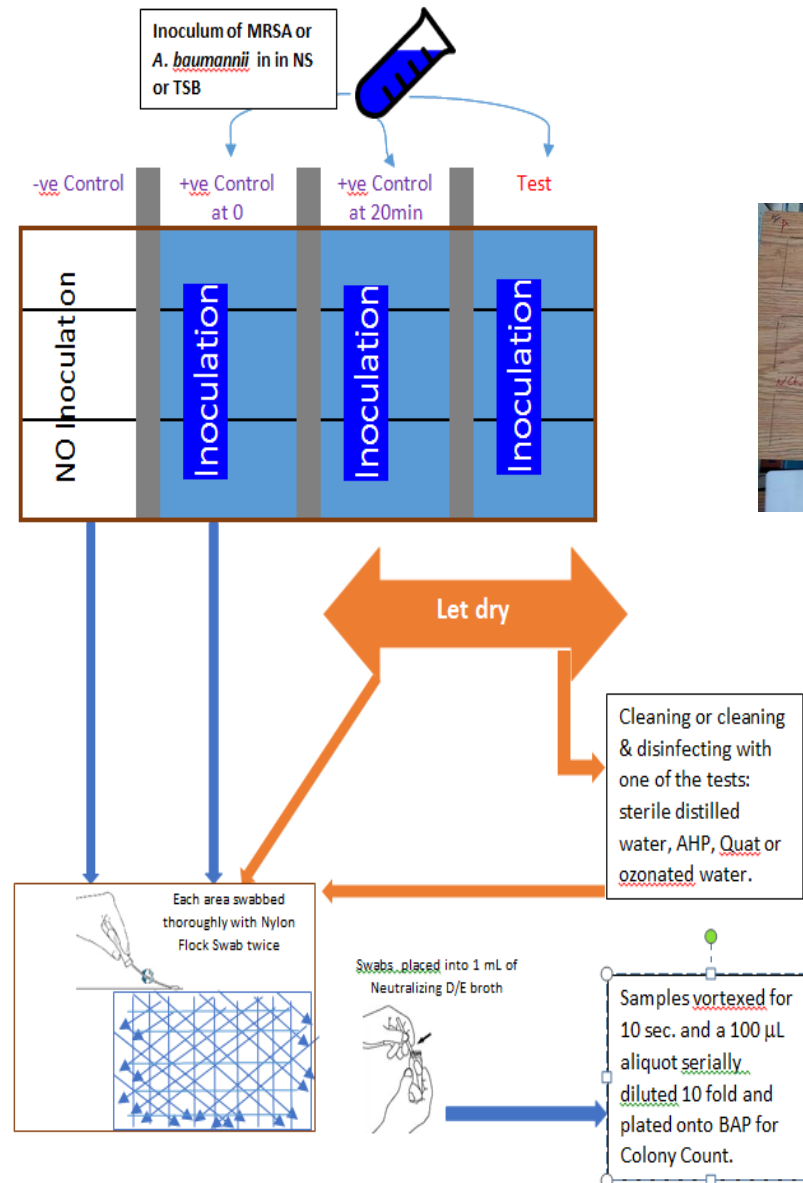

Ozonated water has been evaluated in industrial settings and in vitro

Little information on antimicrobial efficacy in clinical settings

Has potential to be cost effective and safe for staff and patients

# METHODOLOGY

Fig.1 Algorithm for Overbed Tables Inoculation with MRSA or *A. baumannii* then Cleaning +/- Disinfecting with the test solution.

Sample	CFU/ml	% Reduction compared to dried inoculum
Original Inoculum	5.5E+08	
Neg Ctrl t Ctrl	0	
Neg Ctrl t AHP	0	
Neg Ctrl t Oz	0	
Neg Ctrl t CC	0	
After Drying	8.20E+06	
Distilled water and microfiber	36.7	99.99955
Distilled water and cloth rag	93.3	99.99886
AHP and microfiber	0	100
AHP and cloth	100	99.99988
Ozone 1 and microfiber	107	99.9987
Ozone 1 and cloth rag	233	99.9997
Ozone 2 and microfiber	86.7	99.999
Ozone 2 and cloth rag	133	99.9998

# SELF-DISINFECTING SURFACES

# ANTIMICROBIAL MATERIALS

Copper and other heavy  
metals (silver, nickel)

Use dates back to Egyptians

Mechanism: Toxic oxygen  
radical formation

Alloy formulations

Success in recent clinical trials

# NOT KNOWN

Durability

Compatibility with  
cleaning agents

Resistance development

Activity over time

# COPPER ON HIGH TOUCH SURFACES

Antimicrobial copper on high-touch surfaces may decrease transmission of microorganisms

photo courtesy of R. Dixon, CHAIR Canada

# COMPRESSED SALT

Whitlock et al. JHI 2016

**Suggests that  
compressed salt is an  
effective antimicrobial  
surface**

**Intriguing and hypothesis  
generating – requires  
further study**

# PHOTOACTIVATED PAINTS

e.g. Titanium dioxide  
photoactivated, self-cleaning  
UV or fluorescent activation

# ALTERED TOPOGRAPHY

Adaptations of that found  
in nature

Butterfly wings, shark  
skin, fish scales, lotus  
leaves...

# **GENBMT PILOT PROJECT: HCW/Patient/Environmental Surveillance on the Bone Marrow Transplant Ward**

# Bacteria and Other Microbes Live Everywhere in the Environment

Most bacteria  
are harmless  
to people

Certain bacteria  
can even protect  
us from disease

Only a tiny fraction  
of microbes cause  
disease in people

There are 10 times more bacteria on our bodies than our own cells!

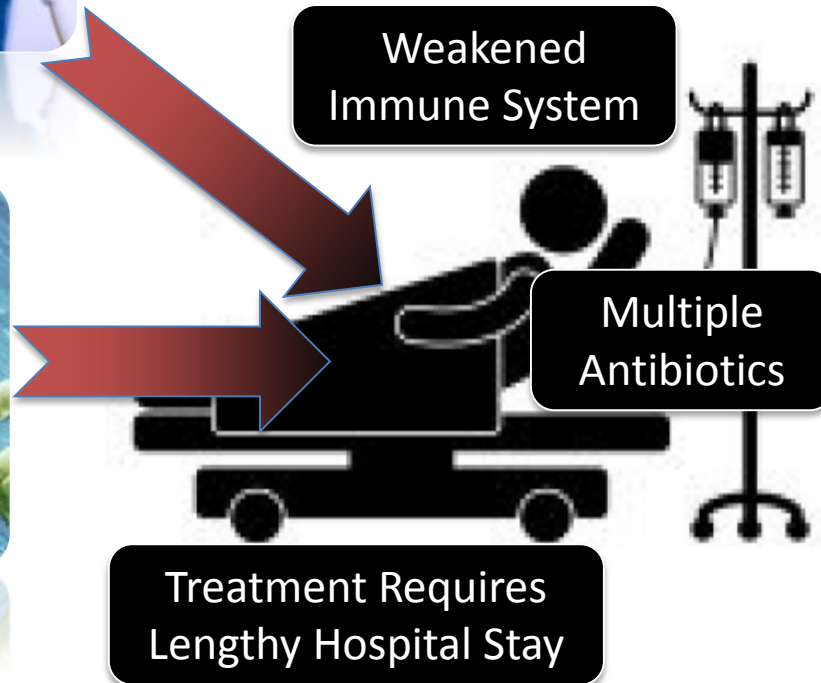

# Bone Marrow Transplant Patients are Especially Vulnerable to Healthcare-Associated Infections

**Aspergillosis**

***Clostridium difficile***

Weakened  
Immune System

Multiple  
Antibiotics

Treatment Requires  
Lengthy Hospital Stay

# Understand HOW and WHEN Microbes are Transmitted in BMT Patients

# Pilot Study: Impact of Re-engineered rooms in Bone Marrow Transplant Patients

**Regular Room**

versus

**Re-engineered Room**

# Objectives

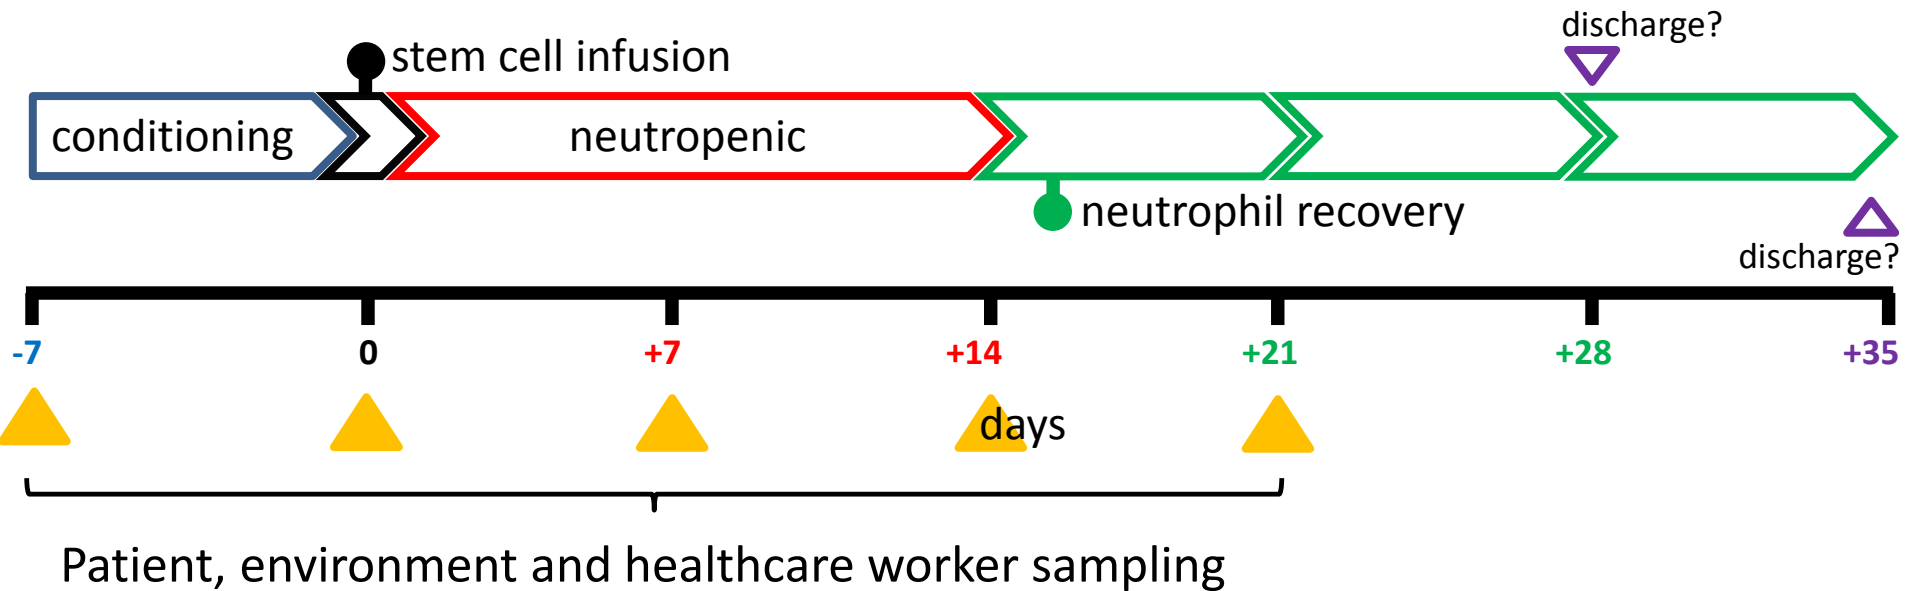

- Assess the impact of re-engineered BMT rooms on microbial bioburden
- Assess the impact of re-engineered BMT rooms on HCW bacterial flora
- Assess the feasibility of collecting specimens and maintaining re-engineered rooms over a one-year period

# Methods

- One year pilot: nine AML patients undergoing Bone Marrow Transplant (BMT) randomized to standard or re-engineered room for ENTIRE duration of stay
- Weekly sampling of a) seven high touch surfaces b) Air (SAS Dual Head Air Sampler) and c) Water (membrane filtration method)
- Weekly sampling of the Healthcare worker and consented patients
  - HCWs = nares, hands, perineum
  - Patients = Baylor wash, stool sample, axillae

**USE CONVENTIONAL MICROBIOLOGY TO IDENTIFY TARGET ORGANISMS AND GENOMICS TO LOOK AT THE MICROBIOME  
(STILL IN PROGRESS)**

# Study Design

# REENGINEERED PATIENT ROOM

RE-  
ENGINEERED  
BMT ROOM

RELATIONSHIP

**TABLE 1: Microbial Bio-Burden Standard vs Re-Engineered Rooms**

<i>Environment</i>	<i>Units</i>	<i>Standard Room</i>	<i>Engineered Room</i>	<i>p-Value</i>
<i>Surfaces</i>	Average CFU/Plate	62.6 (n=147)	6.32 (n=175)	0.0083
	Average RLU	434.4 (n=147)	62.9 (n=182)	0.0001
<i>Water</i>	Average CFU/plate	26.5 (n=20)	0.08 (n=25)	0.0007
<i>Air</i>	Average CFU/plate	14.2 (n=21)	15.6 (n=25)	0.8145

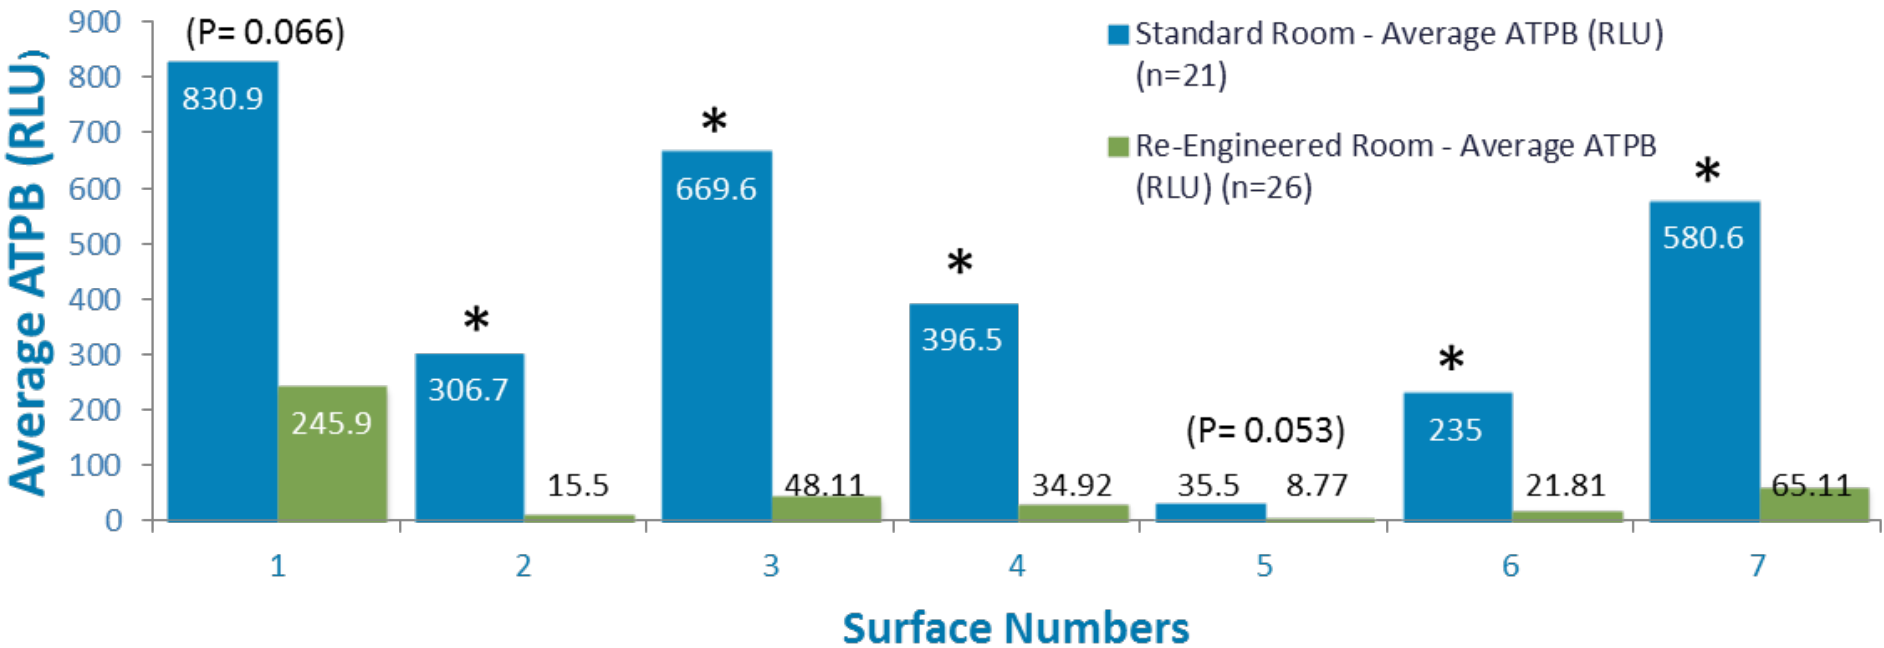

## RODAC (CFU/Plate): Standard vs Re-Engineered Room

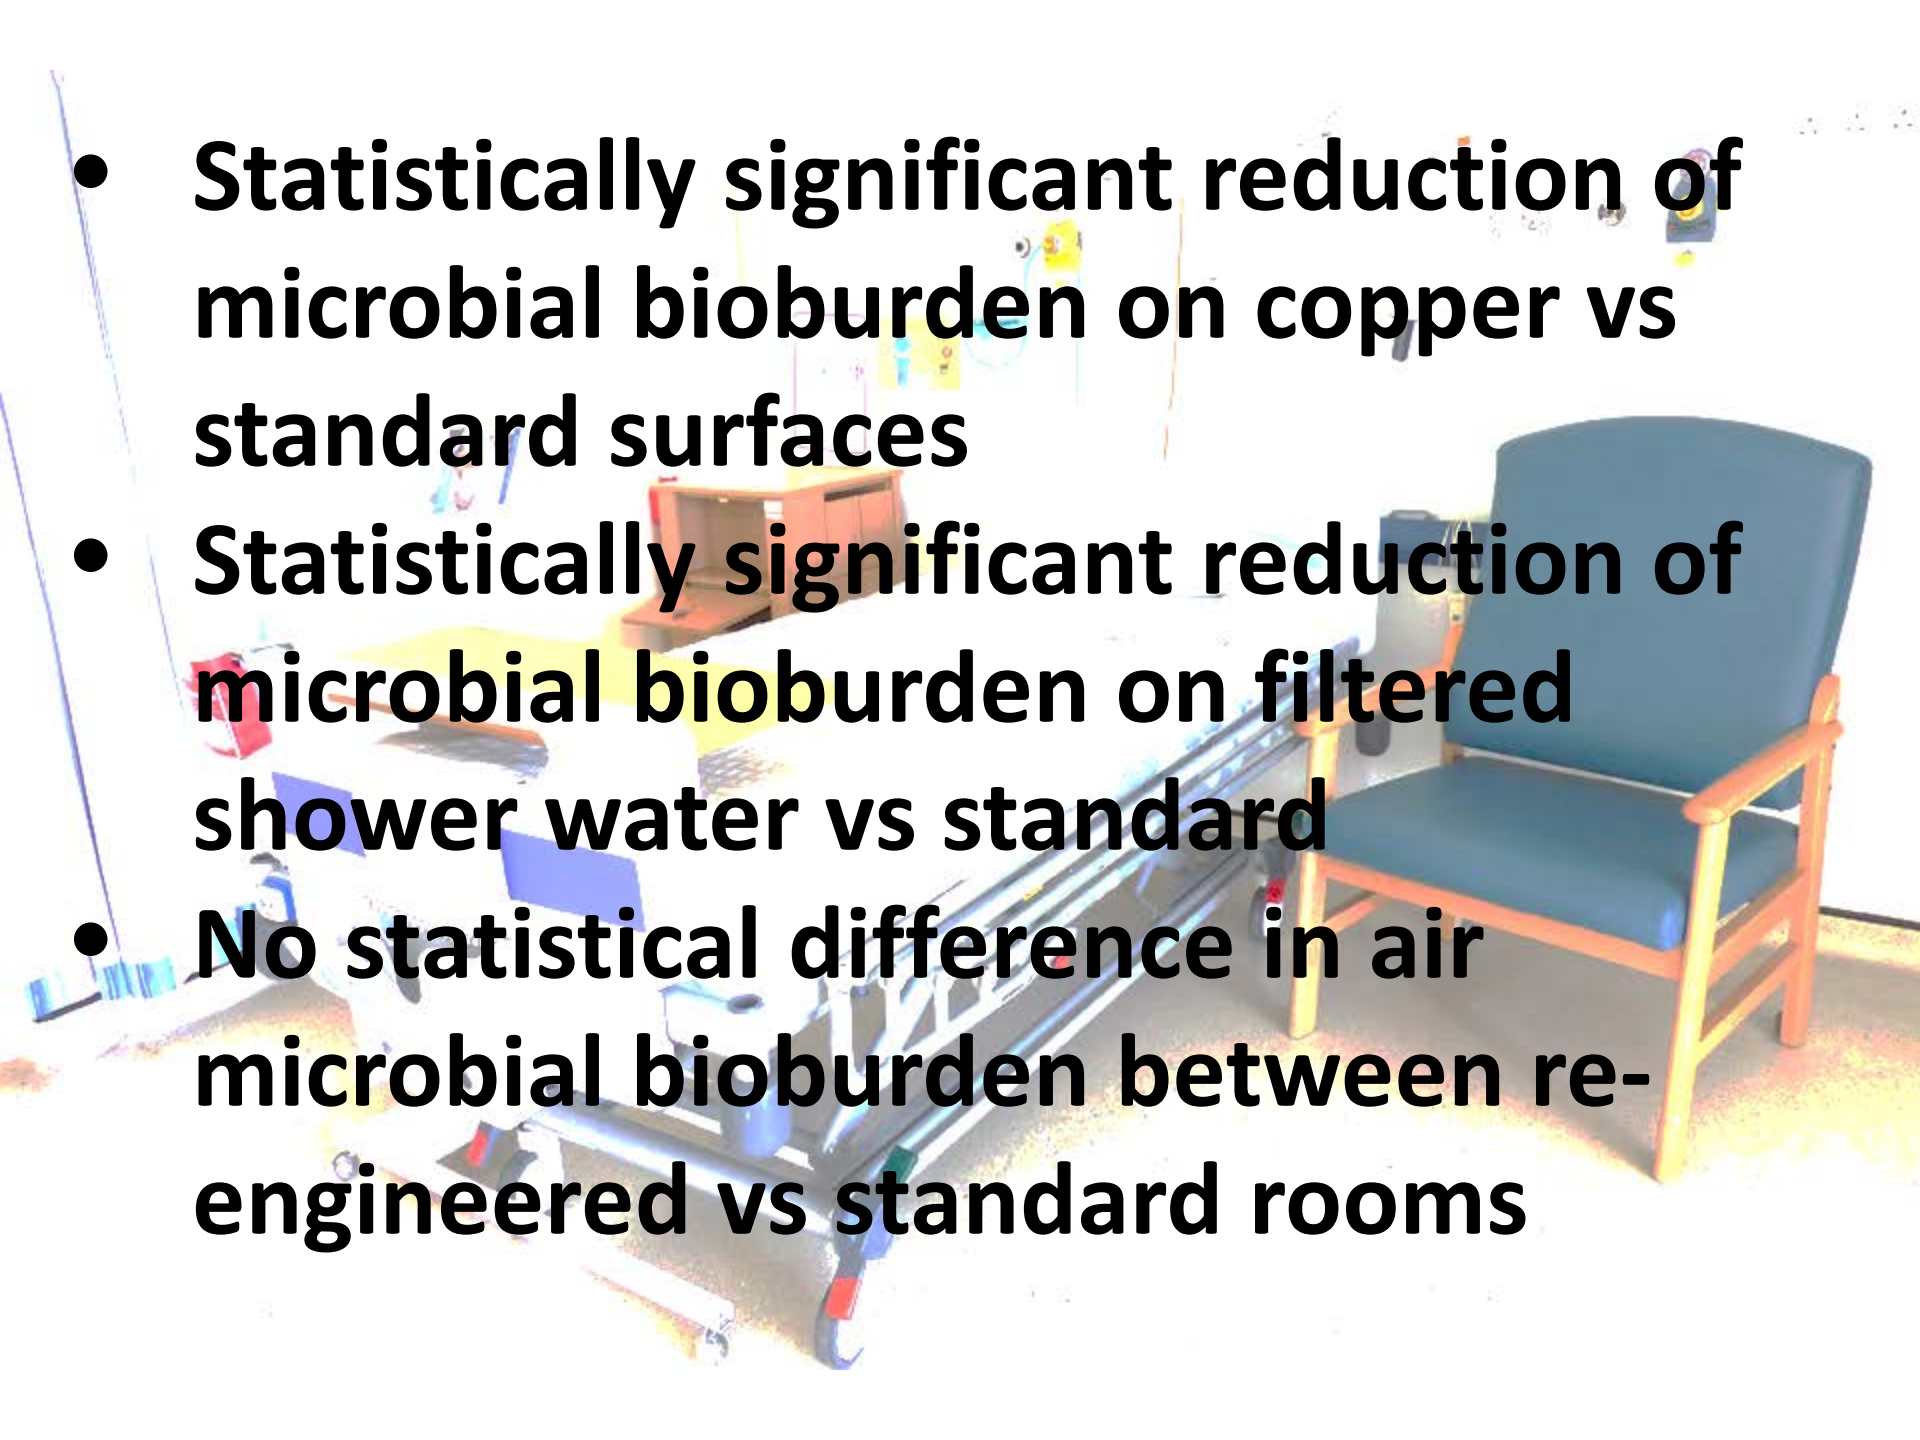

1. Overbed table 2. Bedside table 3. Chair armrest 4. Bedrail. 5. Wall console 6. Toilet seat 7. Bathroom sink

## Average ATPB (RLU): Standard vs Re-engineered Room

1. Overbed table 2. Bedside table 3. Chair armrest 4. Bedrail. 5. Wall console 6. Toilet seat 7. Bathroom sink

- 
- A background image of a hospital room. In the foreground, there is a patient bed with a blue headboard and footboard, and a blue cushioned chair with a wooden frame. The room has white walls and a light-colored floor. There are some medical equipment and supplies visible in the background.
- **Statistically significant reduction of microbial bioburden on copper vs standard surfaces**
  - **Statistically significant reduction of microbial bioburden on filtered shower water vs standard**
  - **No statistical difference in air microbial bioburden between re-engineered vs standard rooms**

A black and white photograph of an elderly couple sitting on a wooden park bench, viewed from behind. They are looking out over a park with trees. The image is semi-transparent, allowing text to be overlaid.

**HCWs**

old-couple-on-park-bench.jpg

**311/352 (88%) opportunities**

**Patients**

**129/144 (90%) opportunities**

**SAMPLING COMPLIANCE**

# *Staphylococcus aureus* carriage

## Healthcare Workers

- 9/32 (28%) positive for sensitive *S.aureus*
  - 5/9 persistently colonized & 2/9 transiently colonized (2/9 HCWs only tested once so colonization persistence is unknown)
  - 1/32 (3%) positive for MRSA (transiently only)

## Patients

- 2/9 (22%) positive
- No patients positive for MRSA

# ***Vancomycin Resistant enterococcus***

## **Healthcare Workers**

- None were positive at any point in the pilot

## **Patients**

- 4/9 patients (44%) positive BUT
- All were acquired **prior** to admission to the BMT unit
- One patient developed a VRE blood infection

# ***Clostridium difficile***

A scanning electron micrograph (SEM) showing several Clostridium difficile bacteria. The bacteria are rod-shaped, with some appearing as single cells and others in pairs. They have a textured, slightly irregular surface. The background is a dark, reddish-brown color with a granular texture.

## **Healthcare workers**

- **None were positive at any time in the pilot**

## **Patients**

- **6/9 (72%) positive**
- **1 was acquired at VGH and developed clinical symptoms requiring treatment**
- **The rest had *C.difficile* prior to admission**

An iceberg floating in the ocean. The tip of the iceberg is visible above the water line, while the much larger, jagged base is submerged below the surface. The sky is blue with a few birds, and the water is dark.

# PILOT KEY FINDINGS

1

Low ARO colonization in healthcare workers

2

High ARO colonization in patients

3

High compliance for ARO surveillance

4

Lower microbial counts on re-engineered rooms

# **LIMITATIONS**

## **NEXT STEPS**

1

small pilot study

2

surveillance compliance  
was not 100%

Image result for Iceberg

1

BCCDC PHL analysis of  
genomics data (LH, MC, AK)

2

Take lessons learned to  
inform larger, multi-center  
study

- 1. Durability in a healthcare environment**
- 2. Potential development of resistance to the self-disinfecting “material”**
- 3. Interaction with hospital cleaners/disinfectants**
- 4. Maintenance and operational costs in addition to capital costs**
- 5. Incremental benefit in reducing infections**

**Innovation is the only  
way to win**

Steve Jobs
